

Chain upgrade and Ink tubes order modification instructions

In order to improve the long-term use of the four-head DTF machine, the ink tubes on both sides of the chain are prone to wear and tear, so upgrades and modifications are made.

1. Chain size upgrade:

The original chain width is 37mm, and the ink tubes are a little tighter along with some other lines.

At present, the chain width has been upgraded to 50mm, and there is sufficient space for the layout of ink tubes and some lines, thereby reducing the friction of ink tubes and lines.

2. Ink tubes order update

According to the analysis of the actual situation, most of the ink tube wear problems occur in the ink tubes on both sides of the 8-row tubes. Therefore, the ink tubes on both sides are updated as empty ink tubes, which can prevent the actually used ink tubes from being worn. (modified as shown)
